**RAMELIUS TO TEST POTENTIAL
NICKEL HOST ZONE AT HILDITCH**

Deeper drilling of a nickel target will be undertaken next month by Ramelius Resources Limited after the Company identified a possible host zone on its Hilditch project in Western Australia.

The Company announced today that it plans to next month drill up to 1,200 metres of Rotary Air Blast (RAB) and percussion drilling on the Hilditch tenement following results from a just-completed first-pass RAB drilling program.

Conducted in March, this program sought to provide an initial assessment of the geology and geochemistry in the vicinity of three electromagnetic conductors in the southwestern corner of the Hilditch tenements in the Eastern Goldfields region.

It located a tremolitic ultramafic unit within a felsic sequence lying adjacent to the northern conductor which lies within bedrock at a depth of 115 metres.

"The new drill program in May will now test the geometry of the identified ultramafic unit to depths of about 90 metres and in particular, its relationship to the northern EM (Electromagnetic) anomaly" Ramelius' Managing Director, Mr Joe Houldsworth, said today.

Mr Houldsworth said the source of the central conductor, located 400 metres to the south of the northern conductor, remained unresolved and further drilling is also planned in this vicinity.

It appeared, however, that the southern conductor and a weak conductor 200 metres further away to the east and adjacent to the magnetic ultramafic were due to chert and black shales. No further drilling was planned for these two southern zones.
